About Me

I am a fullstack software engineering graduate with hands-on experience building end-to-end web applications. Through the REVOU Full-Stack Software Engineering Program, I developed frontend solutions using React, Next.js, and Tailwind CSS, and built backend systems with NestJS, PostgreSQL, and Prisma. As my final project, I delivered a fullstack online movie ticketing application where users can sign up, sign in, browse movies, select seats, purchase tickets, and view ticket history, while administrators manage movies and seat availability through full CRUD operations. This project strengthened my skills in RESTful API development, authentication, database design, and scalable application architecture. I am eager to contribute to a collaborative development team by building reliable, maintainable, and user-focused solutions.

Education

RevoU Full-stack Software Engineering

July, 2025 – Jan, 2026

Completed an intensive 29-week Full-Stack Software Engineering bootcamp covering frontend, backend, and fullstack development through hands-on projects

Final Project: TiBooth Movie Ticketing Website

This project is a fullstack movie ticket booking web application that provides a seamless reservation experience through an integrated frontend and backend system. The platform allows users to browse movie catalogs, view real-time theater schedules, select seats, and manage bookings through a dynamic user interface.

Link to backend: <https://github.com/Cel44/crack-be-Cel44.git>

Universitas Surabaya

July, 2018 – Aug, 2024

IPK: 3.2

Fakultas Hukum

Project Experiences

TiBooth Movie Ticketing Website, Revou Fullstack Software Engineer

Dec 2025 – Jan 2026

I architected and developed a comprehensive end-to-end movie ticketing platform, integrating a high-performance Next.js frontend with a modular NestJS backend. I designed a relational database schema using Prisma ORM to manage complex many-to-many relationships, specifically for dynamic seat availability, synchronized showtimes, and user booking histories. To ensure system security, I implemented JWT-based authentication, role-based access control (RBAC) for administrative CRUD operations, and secure password hashing using Bcrypt. By structuring the backend into specialized domains (Auth, Users, Movies, Showtimes, and Seats), I created a scalable RESTful API that maintains strict data integrity through automated input validation and standardized DTOs.

RevouShop, Revou Fullstack Software Engineer

Oct, 2025

I built RevouShop, a full-featured e-commerce application using Next.js 15. I developed the entire frontend architecture, utilizing the React Context API for real-time cart state management and Tailwind CSS for a mobile-responsive UI. I also implemented an Admin panel with CRUD capabilities and optimized the app with Server-Side Rendering (SSR). To ensure production quality, I authored automated unit tests with Jest, covering login, cart logic, and admin interactions.

RevoFun Web Game, Revou Fullstack Software Engineer

Sep, 2025

I developed Revofun, a browser-based gaming platform featuring three classic titles: Rock Paper Scissors, a Memory Card Game, and a Number Guessing Game. I engineered the core game logic using Vanilla JavaScript and the DOM API, implementing randomized events and real-time state updates. I also designed a fully responsive, mobile-first interface using CSS transitions and Flexbox, ensuring a seamless user experience across all devices without the use of external frameworks.

Additional Information

Technical Skill:

- **Programming Languages:** JavaScript, TypeScript
- **Frontend Frameworks:** React, Next.js
- **Backend Framework:** NestJs
- **Database Management:** PostgreSQL, Prisma

Soft Skills: Problem-Solving, Communication, Adaptability

Certification:

1. [Certificate of Achievement, Revou Fullstack Software Engineer](#)

Feb, 6 2026
